Unique insights exist based on a patient's lifestyle, work, residence, and neighborhood

Algorex Health integrates data insights from the individual, household, and neighborhood levels to capture complete SDOH risk factors without an individual screener or survey.

Algorex aggregates all the data below and creates a non-clinical digital profile for every member.

Data insite categories:

Individual: lifestyle and work

Elements individually-identified and matched residents

- Income/employment
- Educational attainment
- Spending category
- Sector preference
- State assistance
- Housing history
- Vehicle registered

Household

Elements identified by address match

- Household makeup
- Country of origin
- Ownership
- Home quality
- Home type
- Home value
- Household income/employment

Neighborhood

Elements identified by resident location and census group block

- Stress ranking
- Density
- Urban/rural
- Transportation
- WalkScore™
- Food access

From Iteration to Action | Sample Food Program Design

New England health plan client, in partnership with a local health center, implementing a grocery delivery program for food-insecure Medicaid members.

Algorex Health identified food access as priority SDOH gap, identified members with low food access, shared evidence-based program models, completed a partner assessment fulfillment, created program materials (data flow, scripts, training materials, patient surveys, etc.), created a communications plan, and evaluated the pilot outcomes.
